WHO recommendations on drug treatment for non-severe hypertension in pregnancy Special Programme of Research, Development, and Research Training in Human Reproduction (World Health Organization) 2020-07-16 Hypertensive disorders of pregnancy are an important cause of severe morbidity, long-term disability and death among both pregnant women and their babies, and account for approximately 14% of all maternal deaths worldwide. Improving care for women around the time of childbirth is a necessary step towards achievement of the health targets of the Sustainable Development Goals (SDGs). Efforts to prevent and reduce morbidity and mortality during pregnancy and childbirth could also help address the profound inequities in maternal and perinatal health globally. To achieve these goals, healthcare providers, health managers, policy-makers and other stakeholders need up-to-date and evidence-based recommendations to inform clinical policies and practices. In 2019, the Executive Guideline Steering Group (GSG) on WHO maternal and perinatal health recommendations prioritized issuing new WHO recommendations on antihypertensive drugs for non-severe (mild to moderate) hypertension during pregnancy in response to

new important evidence on this intervention. For this guideline, non-severe hypertension and mild to moderate hypertension is used interchangeably, defined as diastolic blood pressure of 90–109 mmHg.

Cardiac Drugs in Pregnancy Karen Sliwa 2013-11-22 The spectrum of cardiovascular disease affecting women in pregnancy and postpartum is changing and differs between countries. In the western world, the risk of cardiovascular disease in pregnancy has increased due to the increasing age at the first pregnancy and the worldwide obesity epidemic leading also to early diabetes and hypertension. In addition the treatment of congenital heart disease has improved leading to an increased number of women with residual heart disease reaching childbearing age. In the western world maternal heart disease is now the major cause of maternal death during pregnancy. In the developing world rheumatic heart disease and the cardiomyopathies dominate. Those women often need anticoagulation as they might have had a valve replacement or formed a thrombus in the left heart. Drugs during pregnancy and the breastfeeding period is a complex subject and there is a profound shortage of evidence based recommendations. As drug treatment in pregnancy concern the mother and the fetus optimum treatment of both must be targeted. This book aims at discussing the most important indications of drug usage in pregnancy and postpartum with the aim of weighing the potential risk of a drug and the possible benefit against each other.
